

A HEALTHY LAWN

Maintaining a newly laid or seeded lawn

Watering: Start watering once the grass has been laid or seeded. Water regularly during the first few weeks – up to twice a day in hot weather.

Mowing: For a lawn that has been laid, wait until the roots have fully developed, between 10 and 20 days, before starting to mow.

Natural soil nutrients: Wait 60 days after the grass has been laid or seeded. Avoid using nutrients in July.

Tips for maintaining a healthy lawn

Soil aeration: Use the coring technique to aerate the soil. This will loosen the soil, help water seep quickly into the ground, distribute fertilizer and help roots grow deeper.

Watering: After every 10-day period without rain, water for a long time but less often. This will help the lawn develop roots and make it more resistant.

Spreading soil, compost and seeds: This will improve soil quality and any damaged areas. It will also increase the thickness of your lawn.

Soil nutrients and natural fertilizers: Give your lawn the nutrients it needs but cannot find in the ground. Soil quality can be preserved through the use of natural nutrients and fertilizers.

Grasscycling: Take advantage of organic material by leaving grass clippings on the lawn. As well as being a natural fertilizer, recycled grass keeps the lawn moist and makes it more resistant to dryness and diseases.

Mowing: Adjust the lawnmower blade to a height of approximately 8 cm. This prevents weeds from spreading, keeps the soil moist and increases the lawn's resistance to harmful insect attacks.

Use these tips to keep your lawn thick,
green and healthy!
